CLAIMS:

Having thus described our invention, what we claim as new, and desire to secure by Letters Patent is:

- 1 1. A user context classifier for a customer self service system that performs resource search
- 2 and selection, said system including a context attribute database comprising types of user
- 3 contexts and one or more context attributes associated with each user context for processing
- 4 by said system, and context attribute function database comprising functions for computing
- 5 values for each context attribute, said classifier comprising a mechanism for receiving a user
- 6 query and a context vector comprising data associating an interaction state with said user and,
- 7 processing said query and context vector against data included in said context attribute
- 8 database and context attribute function database for predicting a particular user context,
- 9 wherein said classifier populates said user context vector with context parameters specifying a
- user interaction state for use in a subsequent resource search.
 - 2. The user context classifier for a customer self service system as claimed in Claim 1,
 - 2 wherein said processing mechanism includes mechanism for applying said functions to
- 3 context for specifying said user interaction state, said mechanism further annotating the
- 4 context vector with a set of context parameters for use in subsequent processing.
- 3. The user context classifier for a customer self service system as claimed in Claim 1,
- 2 wherein said processing mechanism implements an inductive learning algorithm for
- 3 predicting said user contexts.
- 4. The user context classifier for a customer self service system as claimed in Claim 1, further
- 2 including mechanism for updating the attribute value functions database with more enhanced
- 3 functions.

- 5. The user context classifier for a customer self service system as claimed in Claim 1,
- 2 wherein said system further includes a user interaction database comprising data relating to
- 3 past user queries entered into the system and associated user contexts for particular users, said
- 4 mechanism for updating the attribute value functions database comprising mechanism for
- 5 analyzing historical user interaction data from the user interaction database and learning how
- 6 context attribute values map to context attribute functions, wherein said data from the user
- 7 records database serves as a training set for continuous improvement of said functions in said
- 8 attribute function database.
- 1 6. The user context classifier for a customer self service system as claimed in Claim 5,
- 2 wherein said user interaction data includes data relating to previous system interactions, said
- 3 data including user validated contexts that were applicable during said prior system
- 4 interactions, and the users responses relating to those interactions.
- 7. The user context classifier for a customer self service system as claimed in Claim 6,
- 2 wherein said previous system interaction data further includes prior transactions of a current
- 3 user and prior transactions of other similar users, wherein common behaviors and acceptance
- 4 criteria are determined for said updating said functions.
- 8. The user context classifier for a customer self service system as claimed in Claim 7,
- 2 wherein similar users comprise those users with shared organization, community or
- 3 environmental characteristics.
- 9. The user context classifier for a customer self service system as claimed in Claim 5,
- 2 wherein said updating mechanism provides additions and modifications to a set of context
- 3 attribute functions resulting in increasing ability to predict derived contexts as functions of the
- 4 raw contexts.

- 10. A method for classifying user contexts for a customer self service system that performs 1 resource search and selection, said method comprising the steps of: 2 3 a) receiving a user query and a context vector comprising data associating an interaction state 4 5 with said user; 6 b) processing said query and context vector against data included in a context attribute 7 database comprising types of user contexts and one or more context attributes associated with 8 each user context for processing by said system; and 9 10 c) processing said query and context vector against data included in a context attribute 11 function database comprising functions for computing values for each context attribute, 12 wherein said processing steps b) and c) results in predicting a particular user context and 13 populating said user context vector with context parameters specifying a user interaction state 14 for use in a subsequent resource search. 15 11. The method as claimed in Claim 10, wherein said processing step c) further includes the 1 step of applying said functions to context for specifying said user interaction state, said 2 populating step including annotating the context vector with a set of context parameters for 3 4 use in subsequent processing. 12. The method as claimed in Claim 10, wherein said processing step c) further includes the 1 step of implementing an inductive learning algorithm for predicting said user contexts. 2
 - 1 13. The method as claimed in Claim 10, further including the step of updating the attribute
 - 2 value functions database with more enhanced functions.

1 14. The method as claimed in Claim 13, wherein said updating step includes the steps of:

2

- 3 analyzing historical user interaction data from a user interaction database comprising data
- 4 relating to past user queries entered into the system and associated user contexts for particular
- 5 users; and,

- 7 mapping context attribute values to context attribute functions, said data from said user
- 8 records database serving as a training set for continuous improvement of said functions in said
- 9 attribute function database.
- 1 15. The method as claimed in Claim 14, wherein said user interaction data further includes
- 2 data relating to previous system interactions, said data including user validated contexts that
- 3 were applicable during said prior system interactions, and the users responses relating to those
- 4 interactions.
- 1 16. The method as claimed in Claim 15, wherein said previous system interactions includes
- 2 prior transactions of a current user and prior transactions of other similar users, said functions
- 3 updating step including the step of determining common behaviors and acceptance criteria
- 4 from said previous system interactions.
- 1 17. The method as claimed in Claim 16, wherein said similar users comprise those users with
- 2 shared organization, community or environmental characteristics.
- 1 18. The method as claimed in Claim 16, wherein said updating step includes the steps of
- 2 providing additions and modifications to a set of context attribute functions resulting in
- 3 increasing ability to predict derived contexts as functions of raw contexts.
- 1 19. A program storage device readable by machine, tangibly embodying a program of
- 2 instructions executable by the machine to perform method steps for classifying user contexts

- 3 for a customer self service system that performs resource search and selection, said method
- 4 comprising the steps of:
- 5 a) receiving a user query and a context vector comprising data associating an interaction state
- 6 with said user;

7

- 8 b) processing said query and context vector against data included in a context attribute
- 9 database comprising types of user contexts and one or more context attributes associated with
- each user context for processing by said system; and

- 12 c) processing said query and context vector against data included in a context attribute
- 13 function database comprising functions for computing values for each context attribute,
- wherein said processing steps b) and c) results in predicting a particular user context and
- populating said user context vector with context parameters specifying a user interaction state
- 16 for use in a subsequent resource search.
- 1 20. The program storage device readable by machine as claimed in Claim 19, wherein said
- 2 processing step c) further includes the step of applying said functions to context for specifying
- 3 said user interaction state, said populating step including annotating the context vector with a
- 4 set of context parameters for use in subsequent processing.
- 1 21. The program storage device readable by machine as claimed in Claim 19, wherein said
- 2 processing step c) further includes the step of implementing an inductive learning algorithm
- 3 for predicting said user contexts.
- 1 22. The program storage device readable by machine as claimed in Claim 19, further
- 2 including the step of updating the attribute value functions database with more enhanced
- 3 functions.

- 1 23. The program storage device readable by machine as claimed in Claim 22, wherein said
 - 2 updating step includes the steps of:
 - 3 analyzing historical user interaction data from a user interaction database comprising data
 - 4 relating to past user queries entered into the system and associated user contexts for particular
 - 5 users; and,

- 7 mapping context attribute values to context attribute functions, said data from said user
- 8 records database serving as a training set for continuous improvement of said functions in said
- 9 attribute function database.
- 1 24. The program storage device readable by machine as claimed in Claim 23, wherein said
- 2 user interaction data further includes data relating to previous system interactions, said data
- 3 including user validated contexts that were applicable during said prior system interactions,
- 4 and the users responses relating to those interactions.
